# THE ROOT OF ALL TURFGRASS

Working with you to develop **healthy, strong** and **highly functioning** turfgrass root systems

## Please join the GTS Team for this informative educational seminar

A well functioning root system is crucial for maintaining a healthy and vibrant turfgrass surface. Roots anchor the grass to the soil, absorb water and nutrients, and store carbohydrates that help the grass survive stress and disease. A strong root system promotes drought tolerance and improves overall turf density.

To promote healthy roots, proper soil profile preparation, appropriate fertilisation, plant protection, and effective watering practices are essential. Regular aeration and topdressing can also allow roots to grow deeper and stronger.

This seminar will provide valuable insights from prestigious speakers on turfgrass rootzone management that will greatly benefit members of the turf industry.

The seminar will also provide an opportunity for attendees to network with other professionals and industry leaders. We believe that this event will be an excellent opportunity for you to learn and connect with other members of the turf industry.

- Refreshments will be provided throughout the day.
- Q&A sessions will follow each presentation
